Sustainable Features

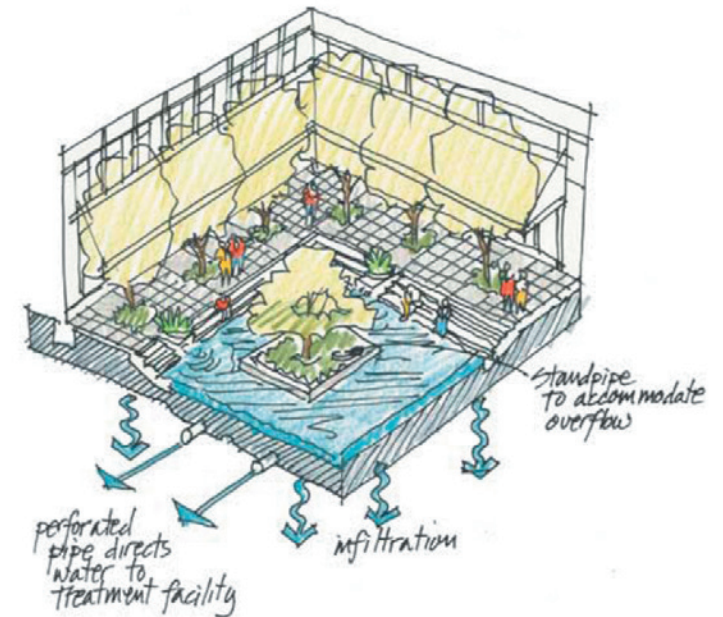

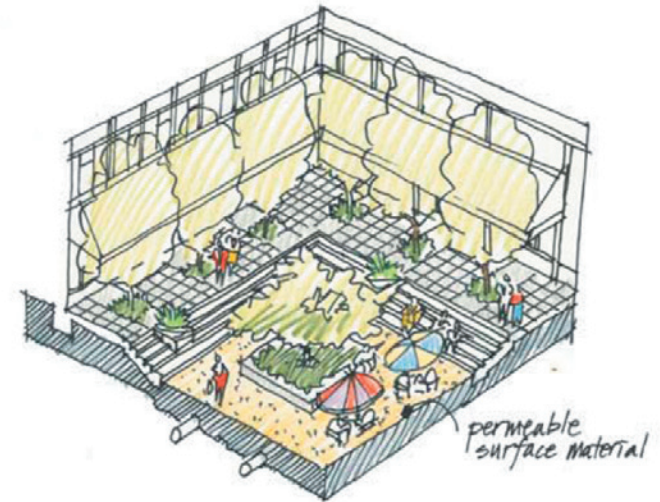

1

Aesthetic of Rain - Aesthetic of Rain is a concept that rain should be an urban amenity rather than a plumbing problem, that cities should come alive in the rain through use of materials and plantings that reinforce the beauty and brilliance of water. The inverted "umbrella" becomes the district icon.

- 4** **Runnels** - Runnels are exposed channels of water that are designed as urban amenity. They can be used to channel clean stormwater to tree pits or other stormwater features.

- 6** **Stormwater overflow plazas** - Stormwater overflow plazas are urban amenities that function as public gathering places all but the wettest days where they serve to temporarily hold high stormwater flows.

- 7** **Water features** - Water features can be sculpture or other design approaches where rainwater is used to provide urban amenity in dense urban areas.

- 16** **Native plantings** - Use of vegetation in urban areas need not always be ornamental plants, especially when appropriate use of native plants can assure plant survival.
